Preface

I solve some exercises and prove some statements from Avigad et al., *Logic and mechanized reasoning* (v 0.1).

Notation

1. $\bigwedge S$ is the least element in the set S (which I assume to be non-empty and strictly ordered).
2. $\bigvee S$ is the greatest element in the set S (which I assume to be non-empty and strictly ordered).

Chapter 1

Introduction

The authors lists three ideas that, it seems, are jointly found for the first time in the work of Ramon Llull (1232?-1316):[1]

1. Symbols can stand for ideas.
2. One can generate compound ideas by combining simpler ones.
3. Mechanical devices can serve as aids to reasoning.

[1] The author spells the monk's last name as "Lull".

Chapter 2

Mathematical background

Key concepts:

1. proof by induction (p. 3)
2. definition by recursion (p. 4)
3. proof by complete induction (p. 5)
4. definition by course-of-values recursion (p. 5).

On p. 5, the authors define the following function recursively:

$$f(n,\ k) = \begin{cases} 1 & \text{if } k = 0 \text{ or } k = n \\ f(n-1,\ k) + f(n-1,\ k-1) & \text{otherwise} \end{cases}$$

where n and k are natural numbers and $k \leq n$. One more usually write the above function as

$$\binom{n}{k} = \begin{cases} 1 & \text{if } k = 0 \text{ or } k = n \\ \binom{n-1}{k} + \binom{n-1}{k-1} & \text{otherwise.} \end{cases}$$

Here $\binom{n}{k}$ indicates the number of ways of choosing k objects out of n without repetition. The equation in the second case, i.e.

$$\binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1}$$

is called *Pascal's identity*. Its intuitive justification is as a follows. Let x be an object among the n-many objects that are given. Then, if you do not choose x, you have to choose k objects from the now $n-1$-many given objects. If you do choose x, then you have to continue by selecting $k-1$ objects from the now $n-1$-many objects. Since every selection of k objects from the given n objects either include or does not include x, then the total number of ways of choosing k objects out of n without repetition is the sum of the ways of selecting k objects from $n-1$ objects (when you do not choose x) and the number of ways of selecting $k-1$ objects from $n-1$ objects (when you choose x).

Theorem 2.1. $\binom{n}{k} = \frac{n!}{k!(n-k)!}$

Proof. □
